

**Object-Oriented Software Engineering**  
Using UML, Patterns, and Java

# Chapter 12, Rationale Management

# *An aircraft example*

## A320

- ◆ First fly-by-wire passenger aircraft
- ◆ 150 seats, short to medium haul

## A319 & A321

- ◆ Derivatives of A320
- ◆ Same handling as A320

## Design rationale

- ◆ Reduce pilot training & maintenance costs
- ◆ Increase flexibility for airline

## *An aircraft example (2)*

### A330 & A340

- ◆ Long haul and ultra long haul
- ◆ 2x seats, 3x range
- ◆ Similar handling as A320 family

### Design rationale

- ◆ With minimum cross training, A320 pilots can be certified to fly A330 and A340 airplanes

### Consequence

- ◆ Any change in these five airplanes must maintain this similarity

# *Overview: rationale*

- ◆ What is rationale?
- ◆ Why is it critical in software engineering?
- ◆ Centralized traffic control example
- ◆ Rationale in project management
  - ◆ **Consensus building**
  - ◆ **Consistency with goals**
  - ◆ **Rapid knowledge construction**
- ◆ Summary

# *What is rationale?*

*Rationale* is the reasoning that lead to the system.

Rationale includes:

- ◆ the *issues* that were addressed,
- ◆ the *alternatives* that were considered,
- ◆ the *decisions* that were made to resolve the issues,
- ◆ the *criteria* that were used to guide decisions, and
- ◆ the *debate* developers went through to reach a decision.

# *Why is rationale important in software engineering?*

Many software systems are like aircraft:

They result from a large number of decisions taken over an extended period of time.

- ◆ Evolving assumptions
- ◆ Legacy decisions
- ◆ Conflicting criteria

-> high maintenance cost

-> loss & rediscovery of information

# *Uses of rationale in software engineering*

- ◆ Improve design support
  - ◆ **Avoid duplicate evaluation of poor alternatives**
  - ◆ **Make consistent and explicit trade-offs**
  
- ◆ Improve documentation support
  - ◆ **Makes it easier for non developers (e.g., managers, lawyers, technical writers) to review the design**
  
- ◆ Improve maintenance support
  - ◆ **Provide maintainers with design context**
  
- ◆ Improve learning
  - ◆ **New staff can learn the design by replaying the decisions that produced it**

# *Representing rationale: issue models*

Argumentation is the most promising approach so far:

- ◆ More information than document: captures trade-offs and discarded alternatives that design documents do not.
- ◆ Less messy than communication records: communication records contain everything.

Issue models represent arguments in a semi-structure form:

- ◆ Nodes represent argument steps
- ◆ Links represent their relationships

# *ATM Example*

**Question:** Alternative Authentication Mechanisms?

**References:** Service: Authenticate

**Decision:** Smart Card + PIN

	<b>Criteria 1:</b> ATM Unit Cost	<b>Criteria 2:</b> Privacy
<b>Option 1:</b> Account number	+	-
<b>Option 2:</b> Finger print reader	-	+
<b>Option 3:</b> Smart Card + PIN	+	+

# Centralized traffic control

- ◆ CTC systems enable dispatchers to monitor and control trains remotely
- ◆ CTC allows the planning of routes and replanning in case of problems

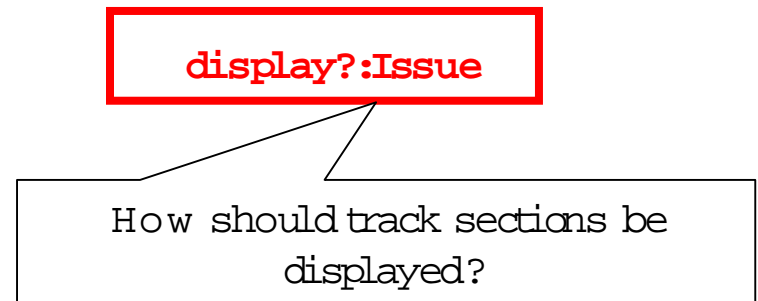

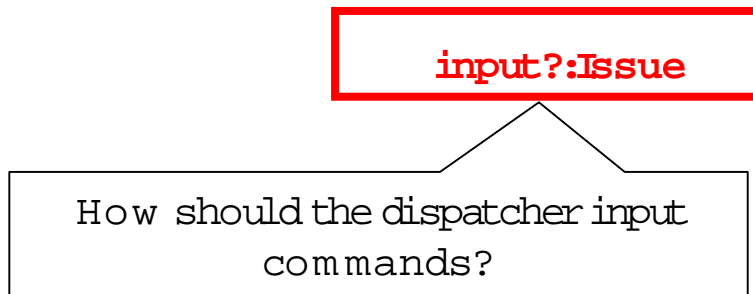

## *Centralized traffic control (2)*

CTC systems are ideal examples of rationale capture:

- ◆ Long lived systems (some systems include relays installed last century)
  - ◆ **Extended maintenance life cycle**
- ◆ Although not life critical, downtime is expensive
  - ◆ **Low tolerance for bugs**
  - ◆ **Transition to mature technology**

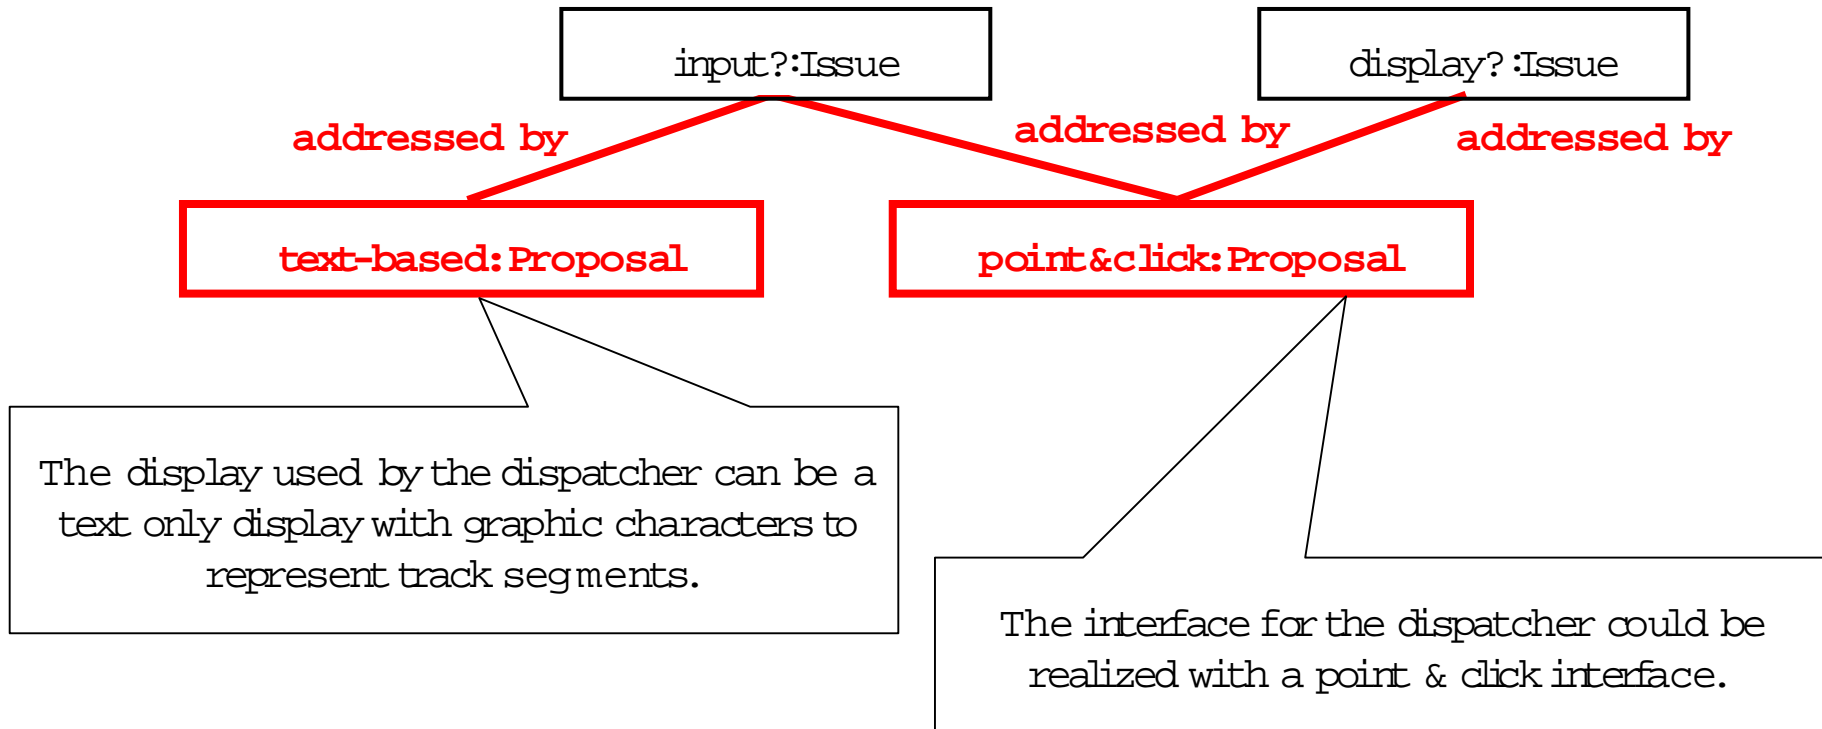

# Issues

- ◆ Issues are concrete problem which usually do not have a unique, correct solution.
- ◆ Issues are phrased as questions.

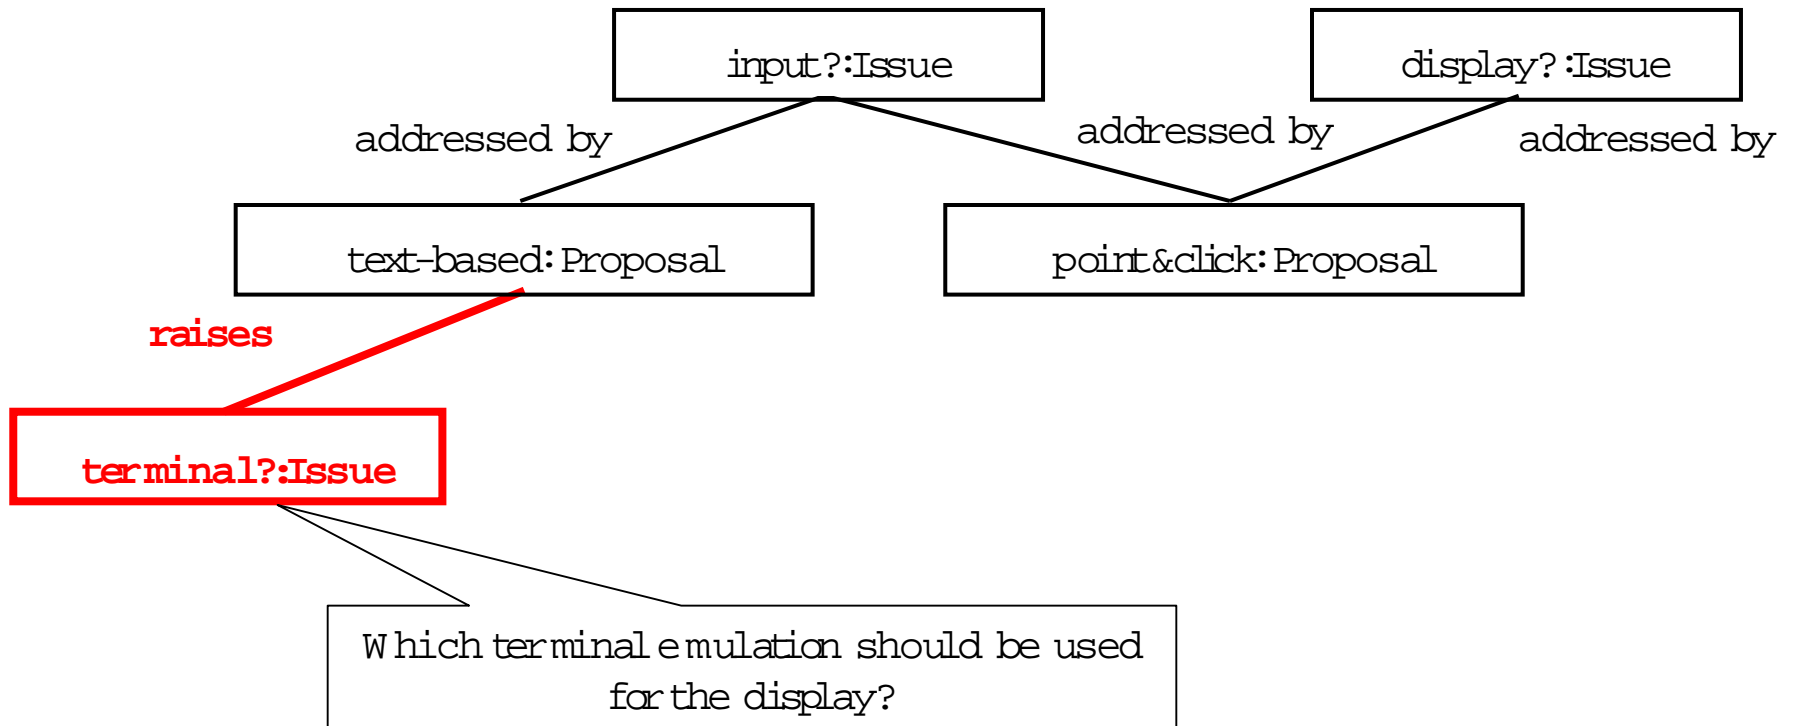

# Proposals

- ◆ Proposals are possible alternatives to issues.
- ◆ One proposal can be shared across multiple issues.

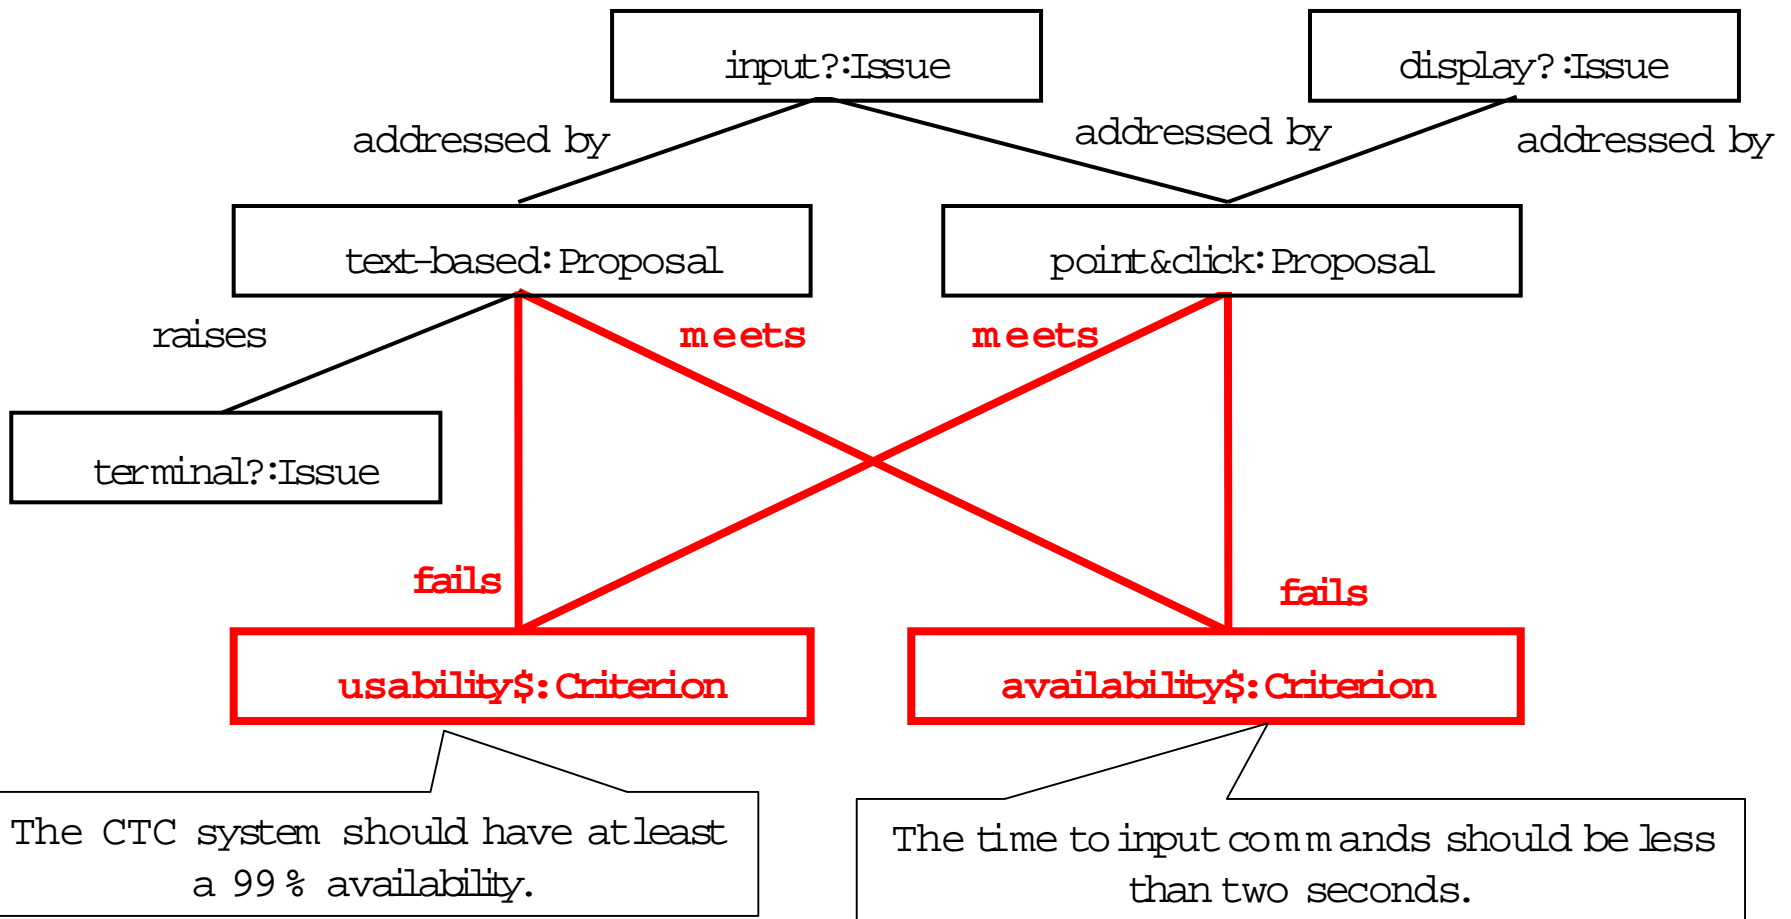

# Consequent issue

- ◆ Consequent issues are issues raised by the introduction of a proposal.

# Criteria

- ◆ A criteria represent a goodness measure.
- ◆ Criteria are often design goals or nonfunctional requirements.

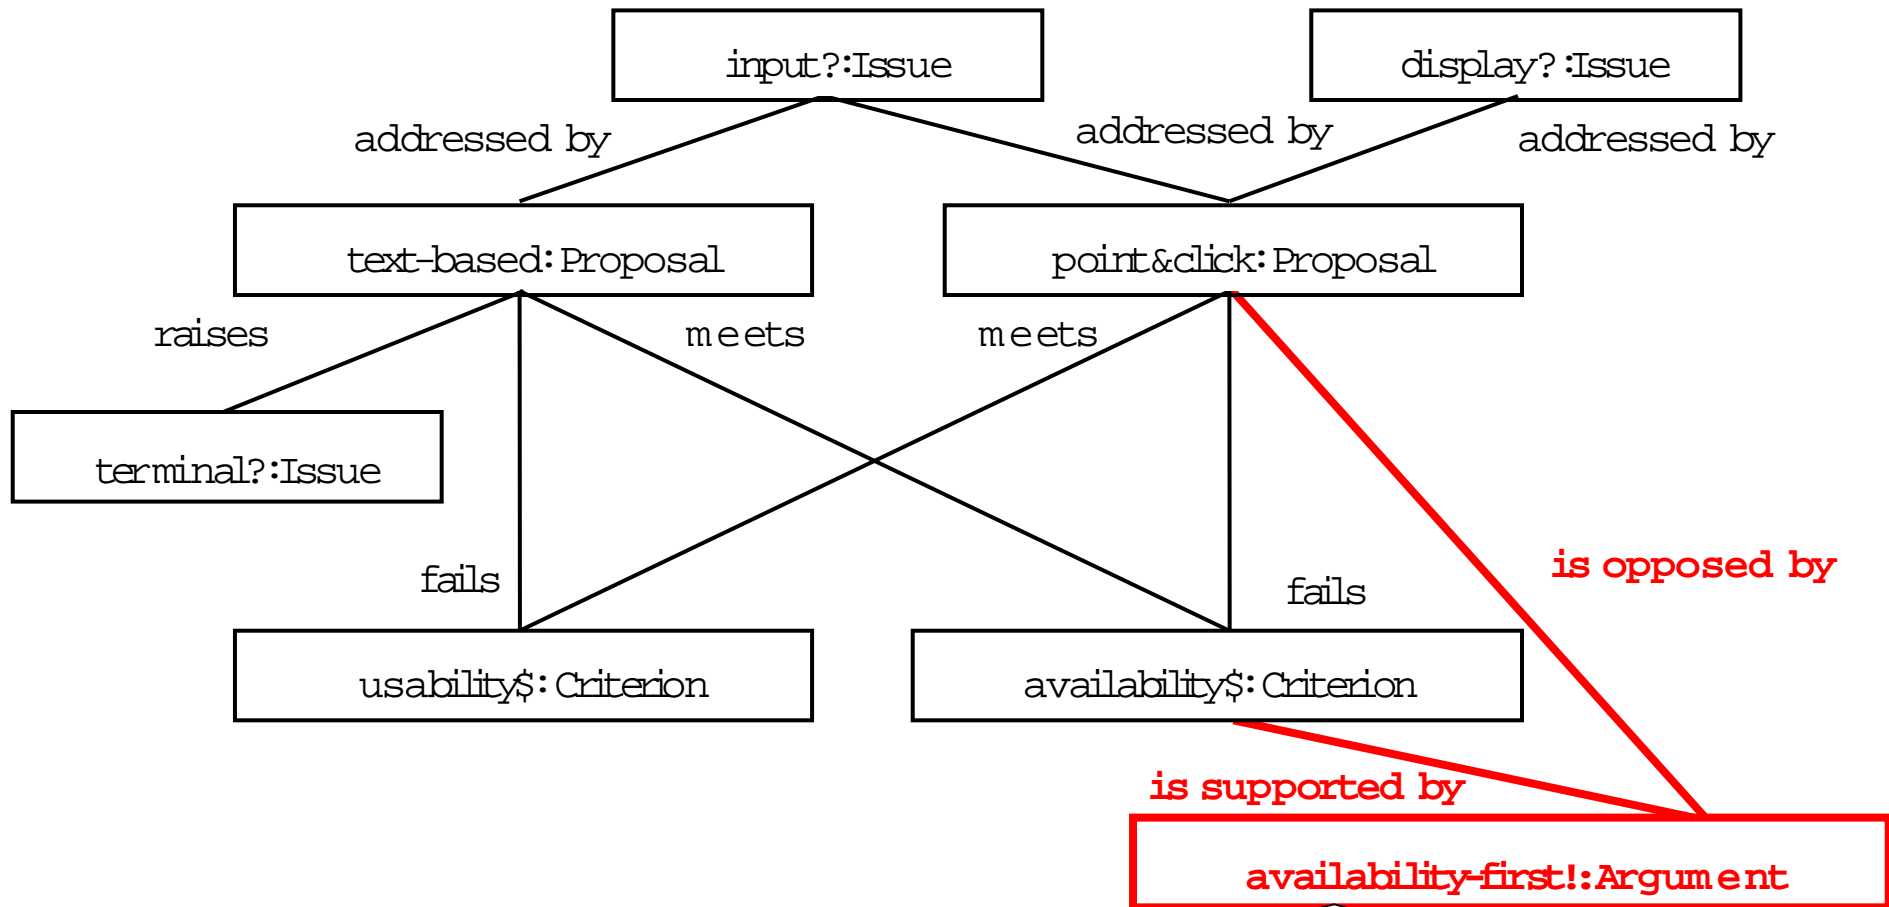

# *Arguments*

- ◆ Arguments represent the debate developers went through to arrive to resolve the issue.
- ◆ Arguments can support or oppose any other part of the rationale.
- ◆ Arguments constitute the most part of rationale.

# Arguments (2)

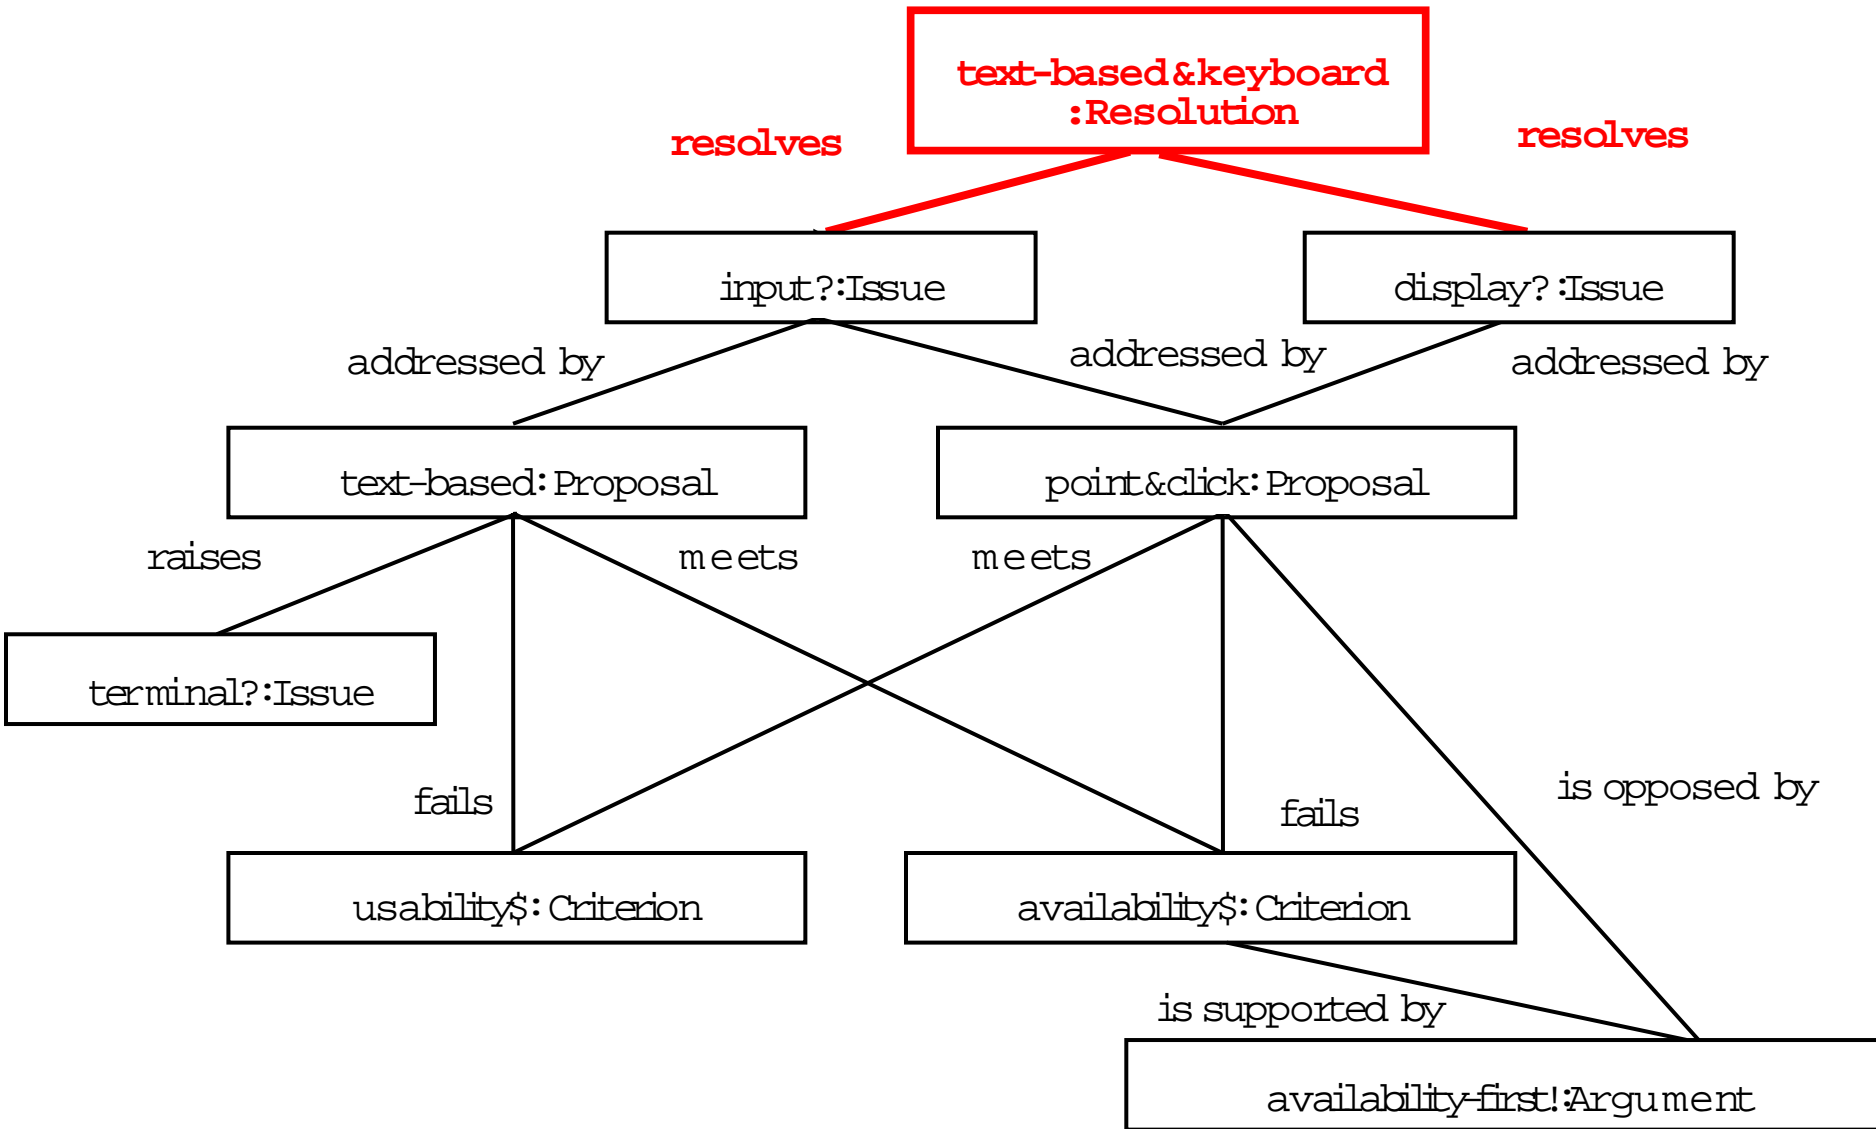

Point&click interfaces are more complex to implement than text-based interfaces. Hence, they are also more difficult to test. The point&click interface risks introducing fatal errors in the system that would offset any usability benefit the interface would provide.

# *Resolutions*

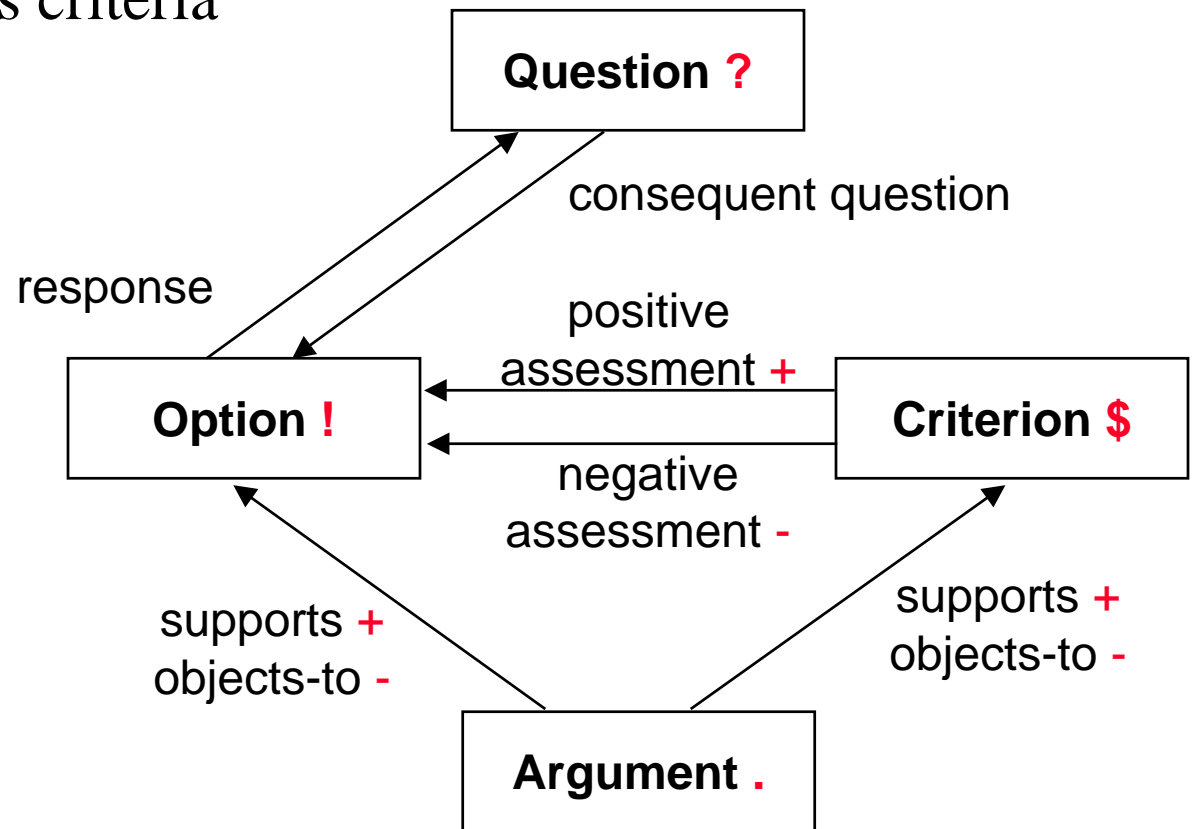

- ◆ Resolutions represent decisions.
- ◆ A resolution summarizes the chosen alternative and the argument supporting it.
- ◆ A resolved issue is said to be closed.
- ◆ A resolved issue can be re-opened if necessary, in which case the resolution is demoted.

# Resolutions (2)

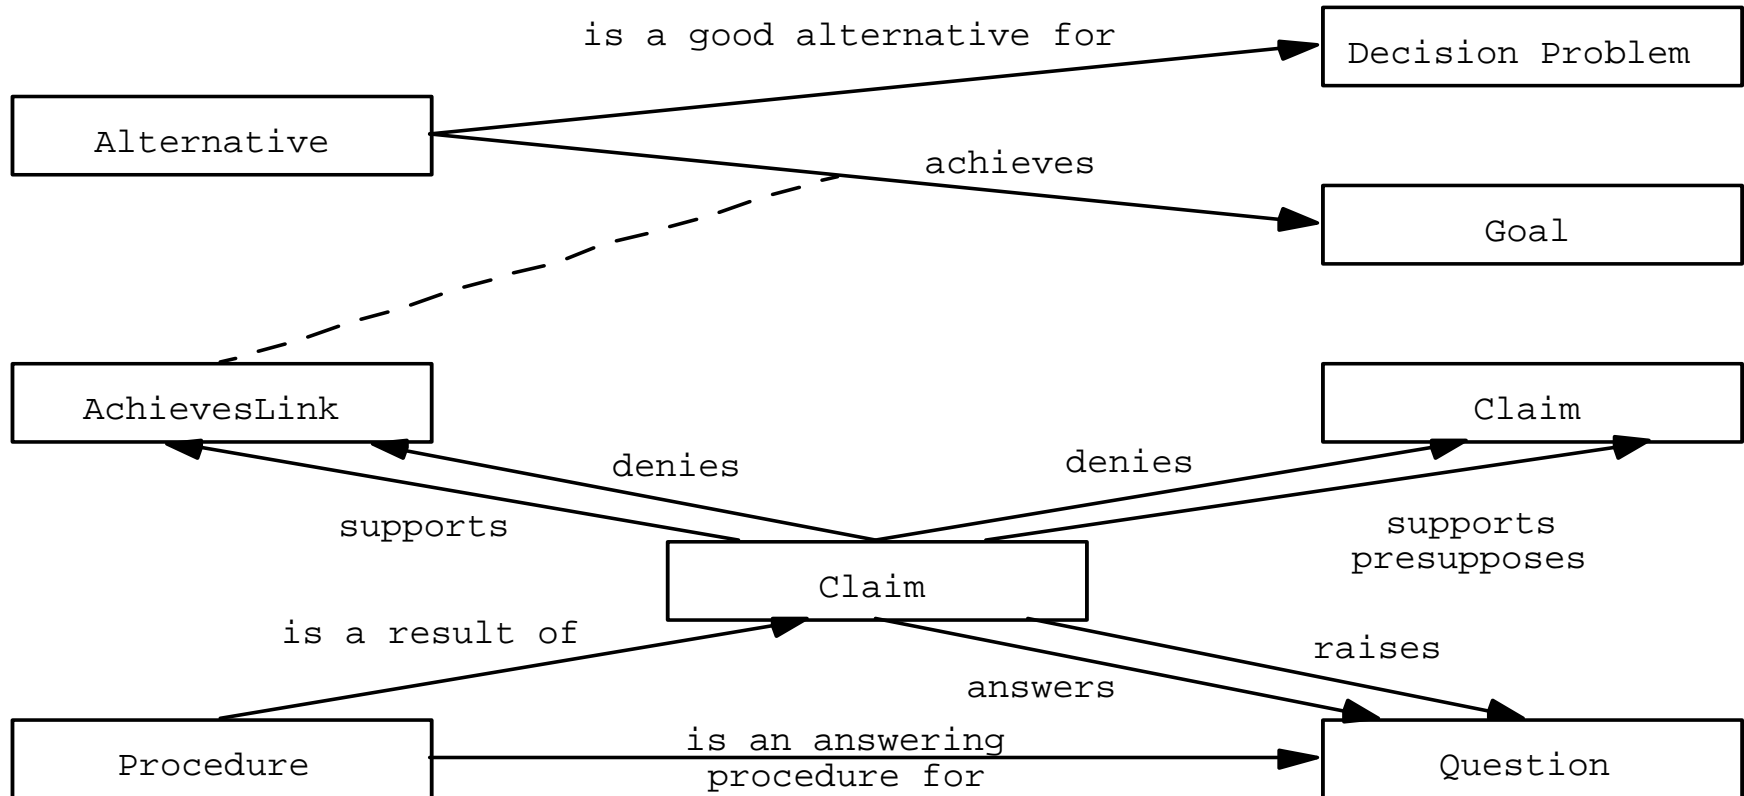

# Questions, Options, Criteria

- ◆ Designed for capturing rationale after the fact (e.g., quality assessment).
- ◆ QOC emphasizes criteria

# *Other issue models: Decision Representation Language*

# *Overview: rationale*

- ◆ What is rationale?
- ◆ Why is it critical in software engineering?
- ◆ Centralized traffic control example
- ◆ Rationale in project management
  - ◆ Consensus building (WinWin)
  - ◆ Consistency with goals (NFR Framework)
  - ◆ Rapid knowledge construction (Compendium)
- ◆ Summary

# *Consensus building*

## Problem

- ◆ Any realistic project suffers the tension of conflicting goals
  - ◆ **Stakeholders come from different background**
  - ◆ **Stakeholders have different criteria**

## Example

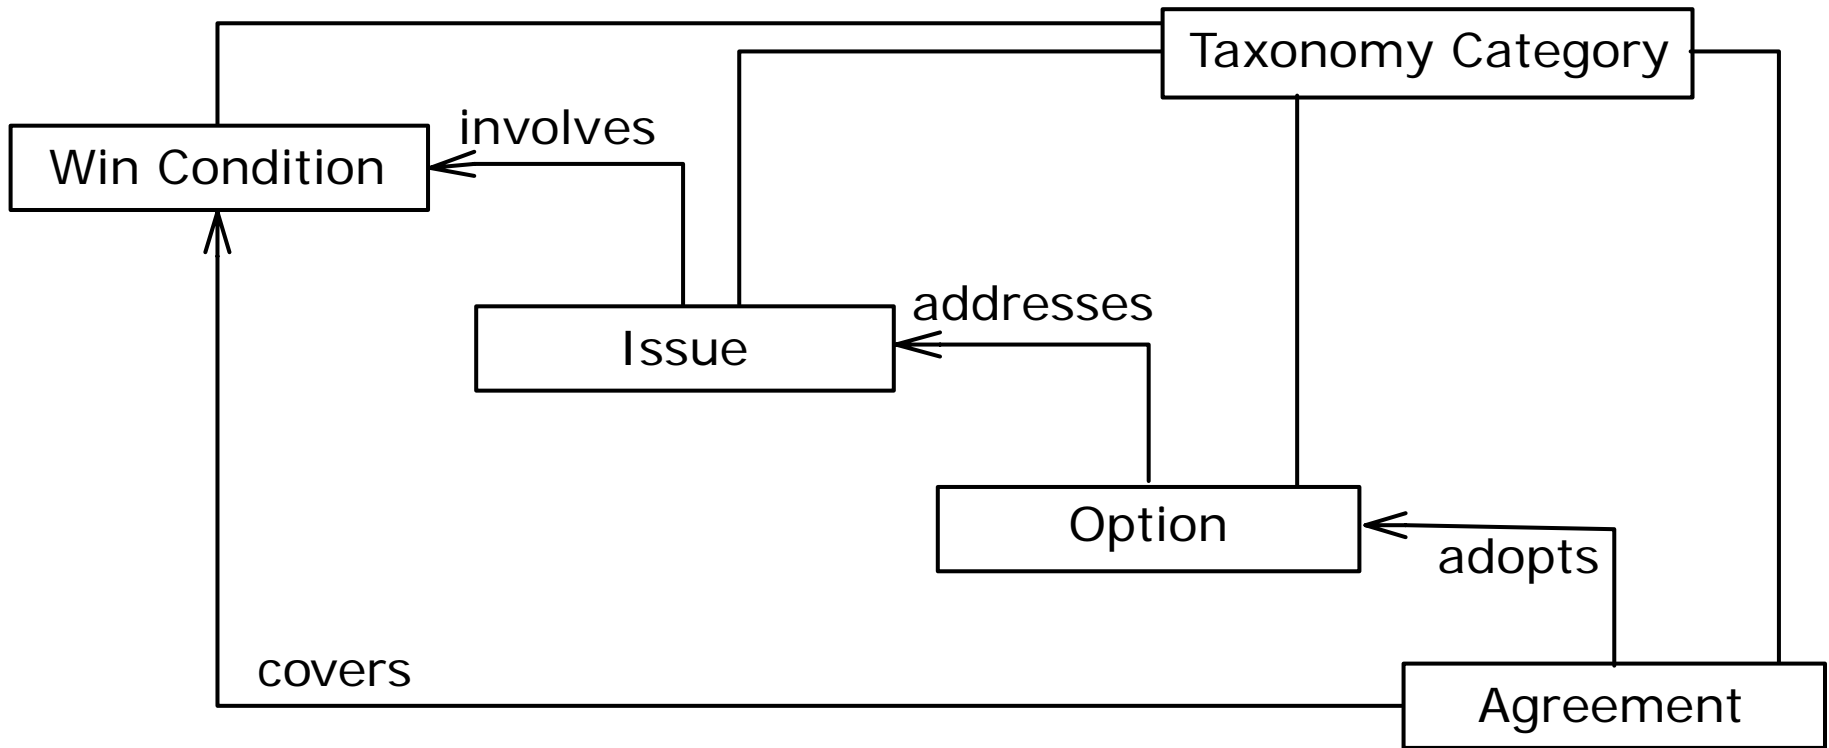

- ◆ Requirements engineering
  - ◆ **Client: business process (cost and schedule)**
  - ◆ **User: functionality**
  - ◆ **Developer: architecture**
  - ◆ **Manager: development process (cost and schedule)**

# *Consensus building: WinWin*

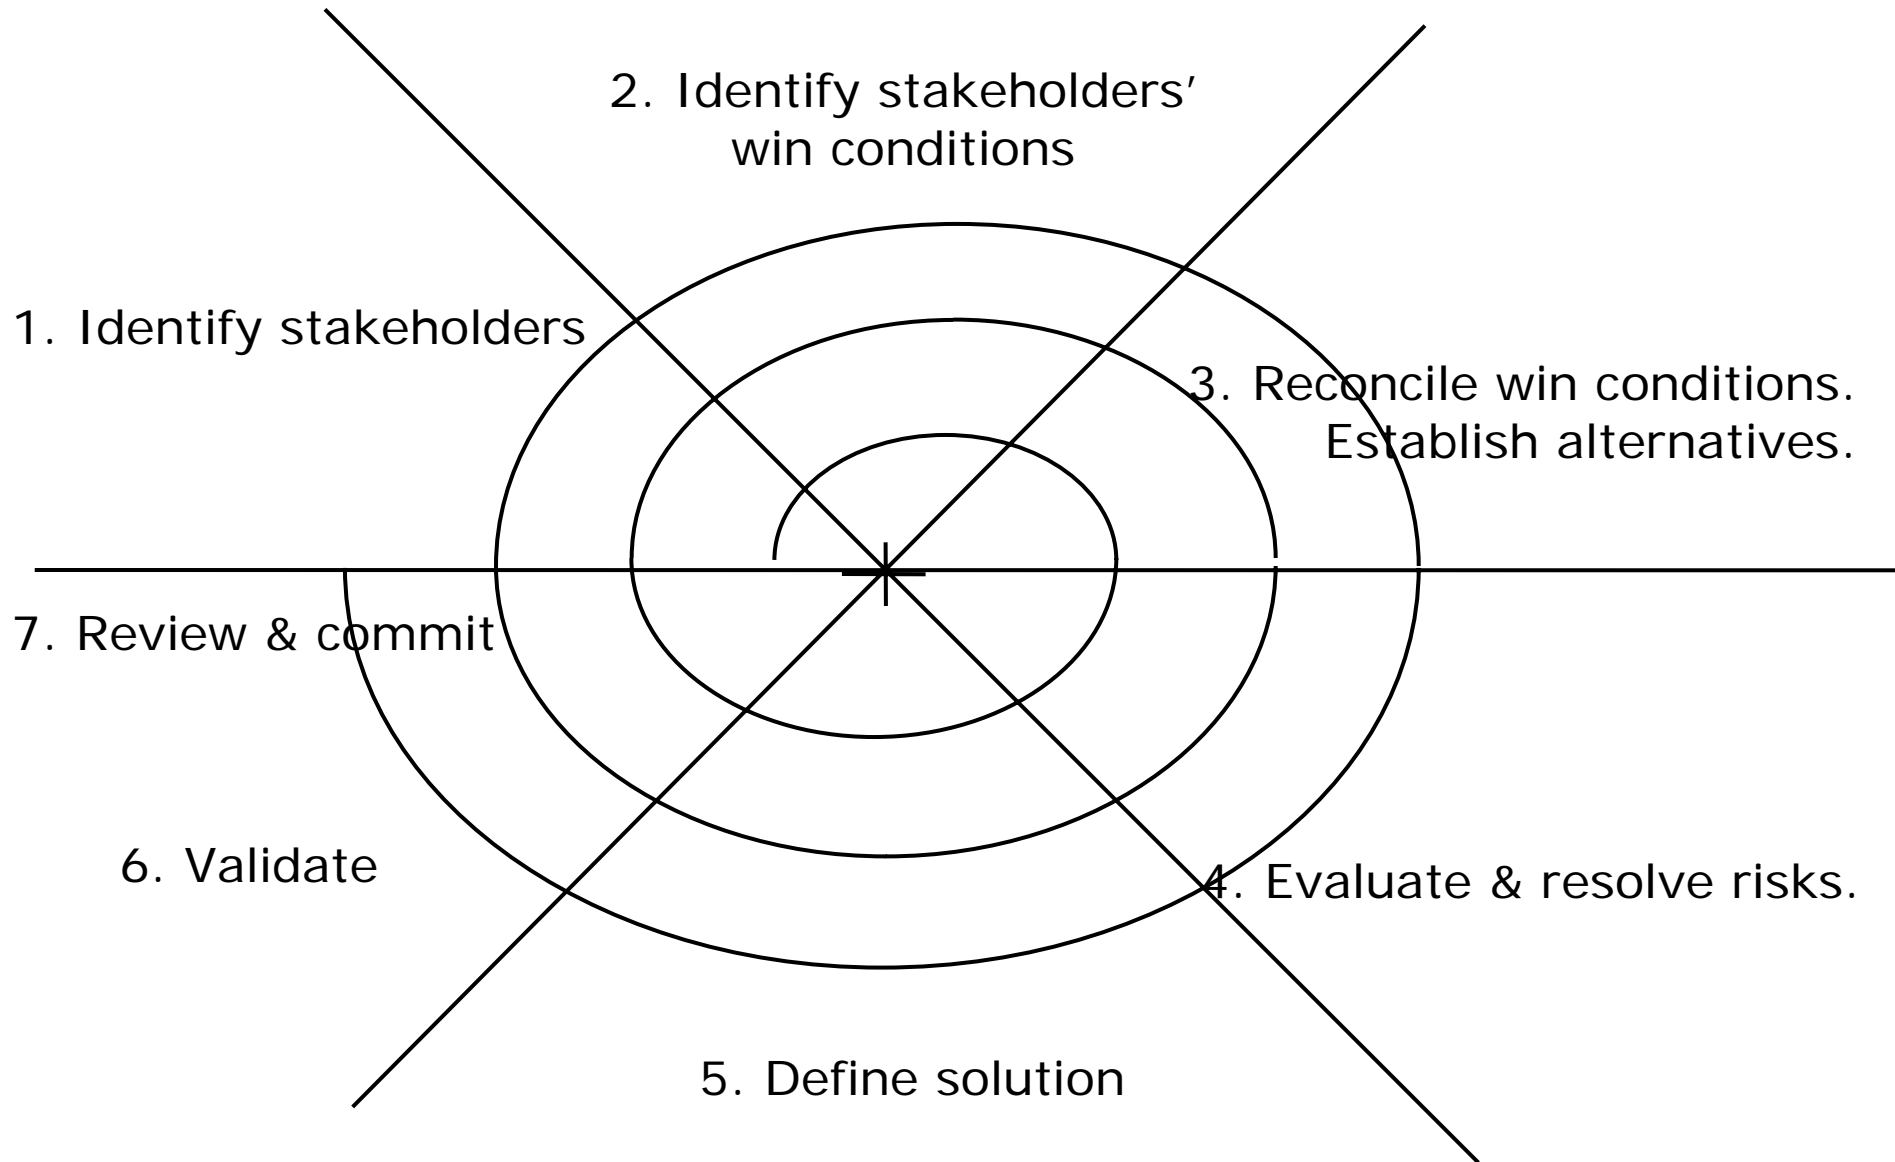

- ◆ Incremental, risk-driven spiral process
  - ◆ **Identification of stakeholders**
  - ◆ **Identification of win conditions**
  - ◆ **Conflict resolution**
  
- ◆ Asynchronous groupware tool
  - ◆ **Stakeholders post win conditions**
  - ◆ **Facilitator detects conflict**
  - ◆ **Stakeholders discuss alternatives**
  - ◆ **Stakeholders make agreements**

# Consensus building: Model

# *Consensus building: Process*

# Consensus building: WinWin tool

The screenshot displays the WinWin tool interface, which is a graphical user interface for building consensus. The main window is titled "X-WINWIN 2.0 (wolfi) - \*Meeting\_Scheduler" and has a menu bar with "Project", "Taxonomy", "Artifacts", "Tools", and "Messages". The main area shows a terminal window with the command "cd tmp/wi" and a list of artifacts. Below the terminal are four windows, each representing a different type of artifact:

- Win Conditions (Orange window):** Contains a table of artifacts with the following data:

ID	State	Name
wolfi-WINC-4	Uncovered	The system should be omniscient.
wolfi-WINC-3	Uncovered	Replanning Meetings must be possible
wolfi-WINC-2	Uncovered	Cost <= 30k\$
wolfi-WINC-1	Uncovered	Automatically Find Meeting Date
- Options (Yellow window):** Contains a table of artifacts with the following data:

ID	State	Name
wolfi-OPTH-1	Unused	Require some user interaction
- Issues (Red window):** Contains a table of artifacts with the following data:

ID	State	Name
wolfi-ISSU-2	Unresolved	Cost, omniscience conflict
wolfi-ISSU-1	Unresolved	System needs user interaction.
- Agreements (Green window):** Contains a table of artifacts with the following data:

ID	State	Name
wolfi-AGRE-1		Not complete omniscience

# *Consensus building: Experiences*

## Context

- ◆ Initial case studies used project courses with real customers
- ◆ Used in industry

## Results

- + Risk management focus
- + Trust building between developers and clients
- + Discipline
- Inadequate tool support

# *Consistency with goals*

## Problem

- ◆ Once multiple criteria have been acknowledged
  - ◆ **Find solutions that satisfy all of them**
  - ◆ **Document the trade-offs that were made**

## Example

- ◆ Authentication should be *secure*, *flexible* for the user, and *low cost*.

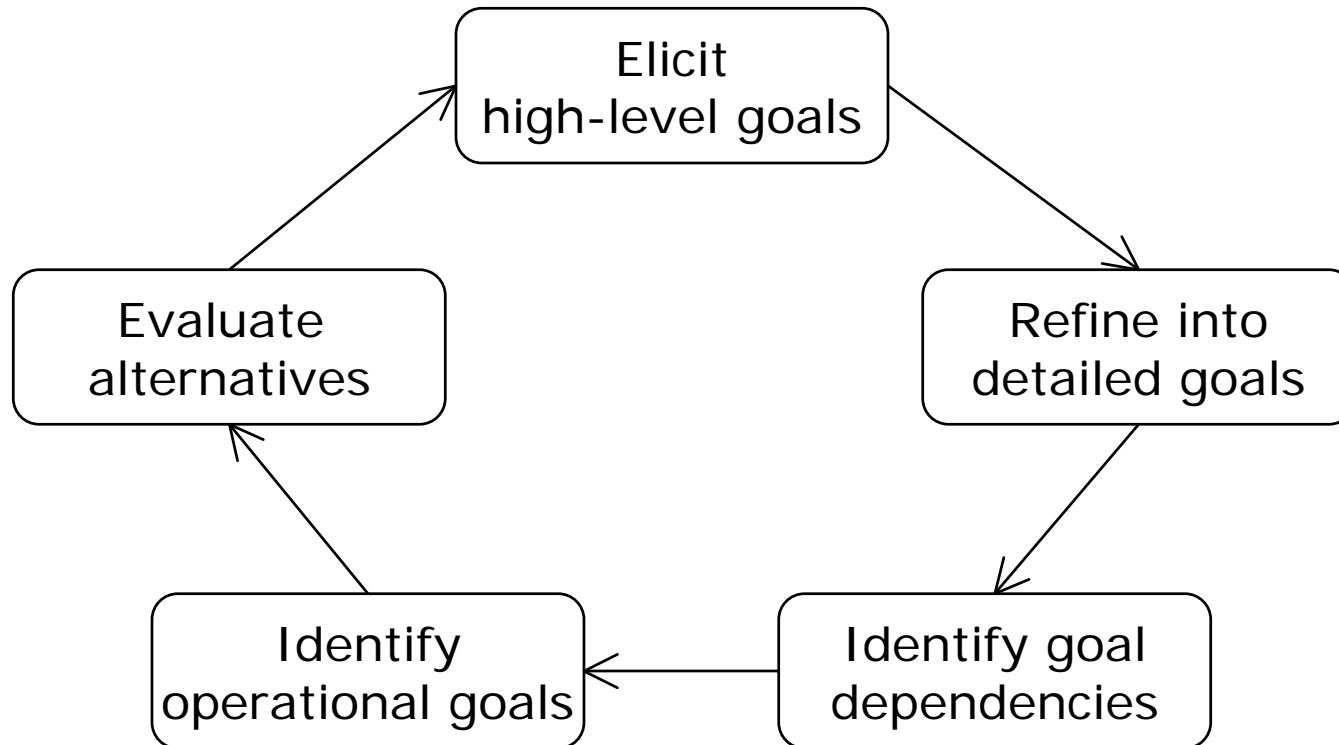

# *Consistency with goals: NFR Framework*

- ◆ **NFR goal refinement**
  - ◆ **NFRs are represented as goals in a graph**
  - ◆ **Leaf nodes of the graph are operational requirements**
  - ◆ **Relationships represent “help” “hurt” relationships**
  - ◆ **One graph can represent many alternatives**
  
- ◆ **NFR evaluation**
  - ◆ **Make and break values are propagated through the graph automatically**
  - ◆ **Developer can evaluate different alternatives and compare them**

# Consistency with goals: Model

# *Consistency with goals: Process*

# *Consistency with goals: Experiences*

- + Case studies on existing systems lead to clearer trade-offs
- + Research into integrating NFR framework and design patterns
  - ◆ **Match NFRs to design pattern “Forces”**
  - ◆ **Link NFRs, design patterns, and functional requirements**
- Tool support important

# *Rapid knowledge construction*

## Problem

- ◆ When a company is large enough, it doesn't know what it does.
  - ◆ **Knowledge rarely crosses organizational boundaries**
  - ◆ **Knowledge rarely crosses physical boundaries**

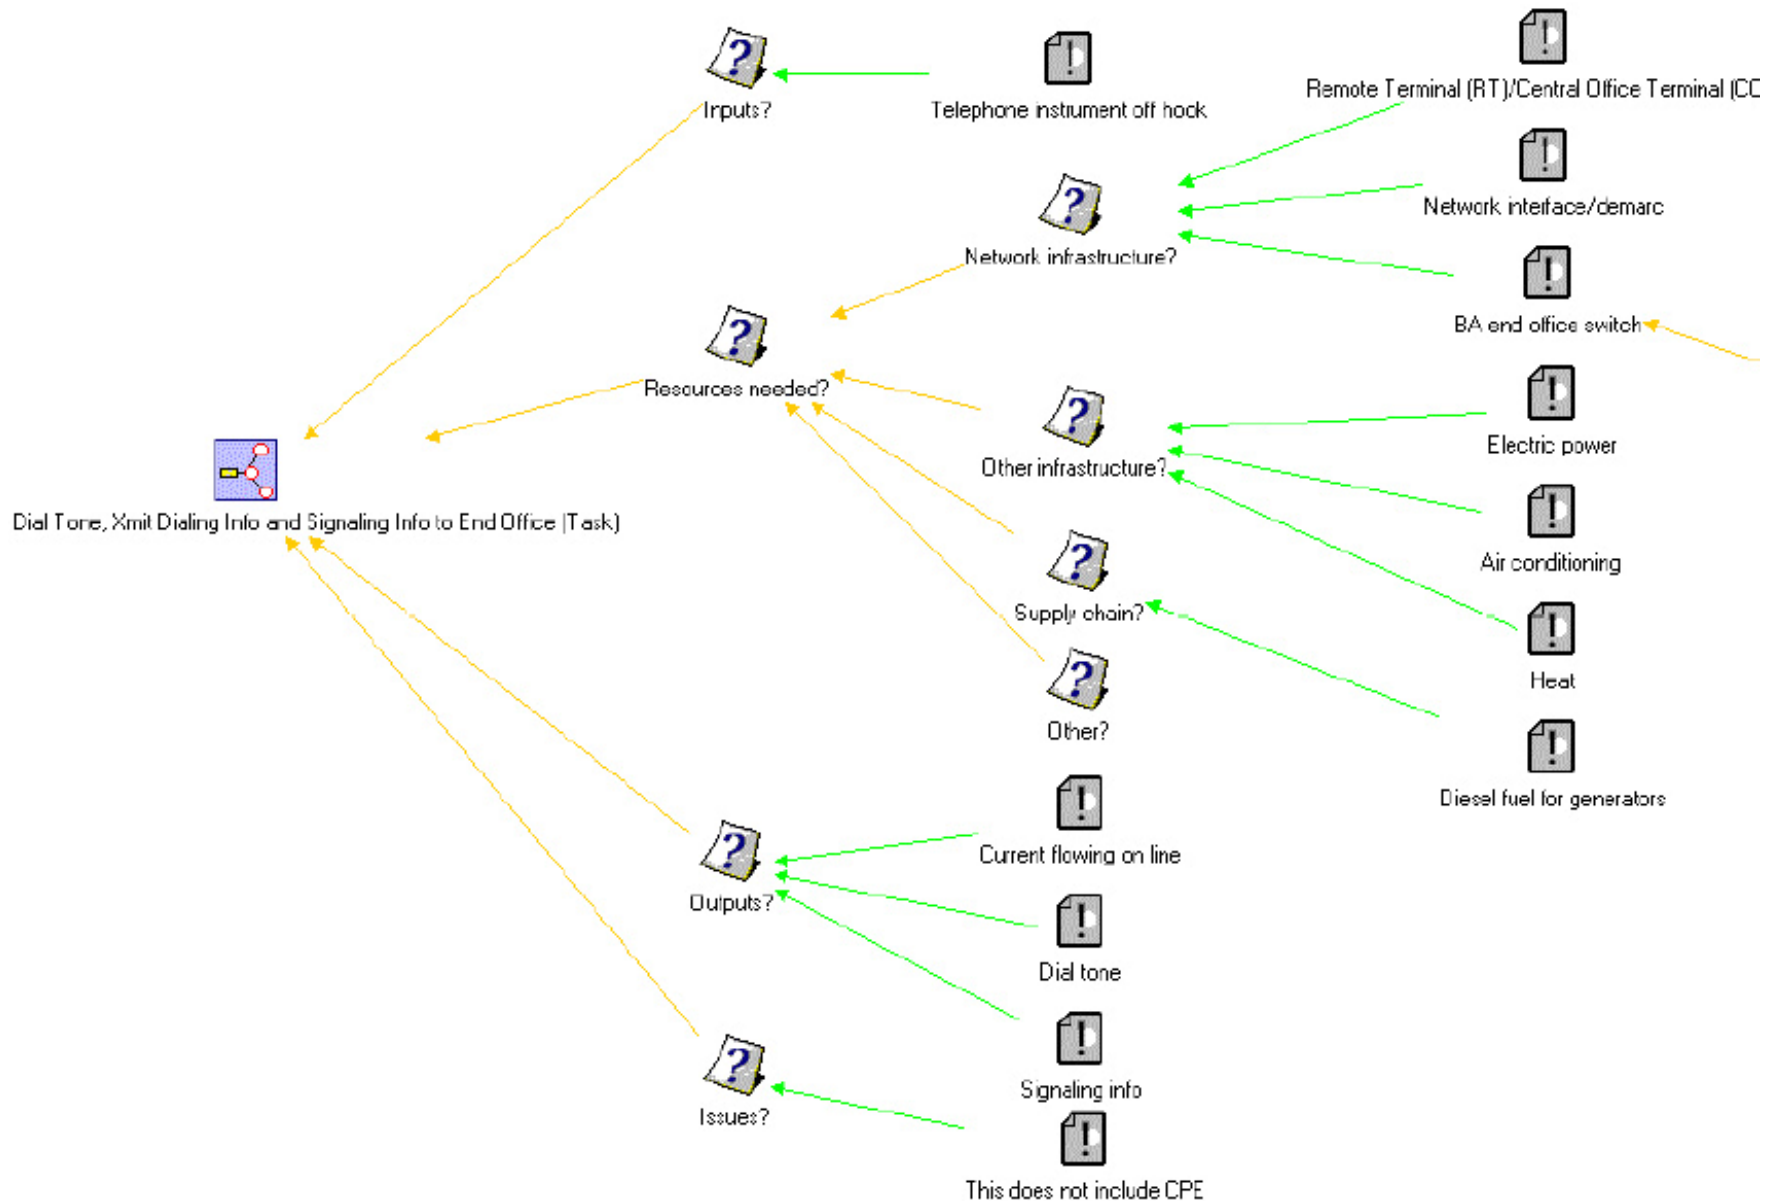

## Example

- ◆ Identify resources at risk for Y2K and prioritize responses.

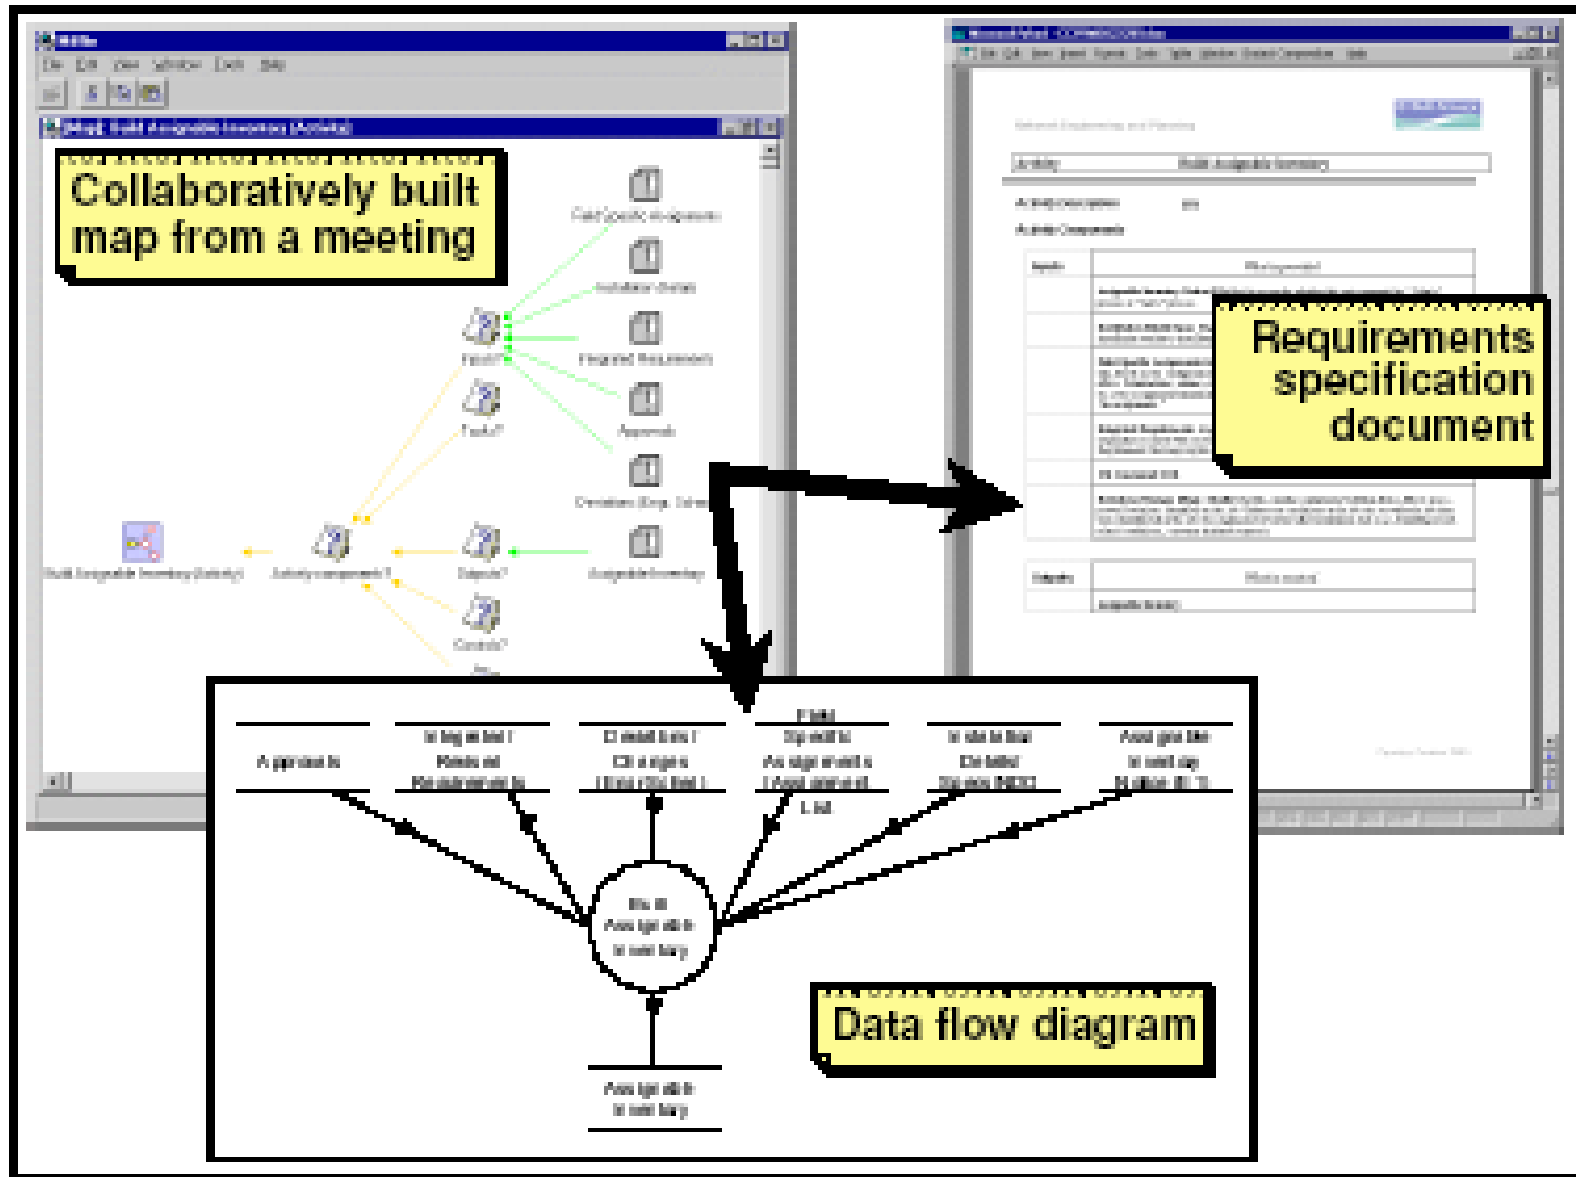

# *Rapid knowledge construction: Compendium*

- ◆ Meeting facilitation
  - ◆ **Stakeholders from different business units**
  - ◆ **External facilitator**
- ◆ Real-time construction of knowledge maps
  - ◆ **The focus of the meeting is a concept map under construction**
  - ◆ **Map includes the issue model nodes and custom nodes (e.g., process, resource, etc.)**
- ◆ Knowledge structuring for long term use
  - ◆ **Concept map exported as document outline, process model, memos, etc.**

# Rapid knowledge construction: Model

# Rapid knowledge construction: Process example

# *Rapid knowledge Construction: Experiences*

## Context

- ◆ Several industrial case studies, including Y2K contingency planning at Bell Atlantic

## Results

- ◆ Increased meeting efficiency (templates are reused)
- ◆ Knowledge reused for other tasks

# *Summary*

- ◆ Rationale can be used in project management
  - ◆ **To build consensus (WinWin)**
  - ◆ **To ensure quality (NFR Framework)**
  - ◆ **To elicit knowledge (Compendium)**
  
- ◆ Other applications include
  - ◆ **Risk management**
  - ◆ **Change management**
  - ◆ **Process improvement**
  
- ◆ Open issues
  - ◆ **Tool support**
  - ◆ **User acceptance**
